Xylella fastidiosa

- Xylem-limited bacterium. Invades xylem vessels and produces biofilms
- First description of the disease in 1887 (USA)
- First isolation on media in 1978

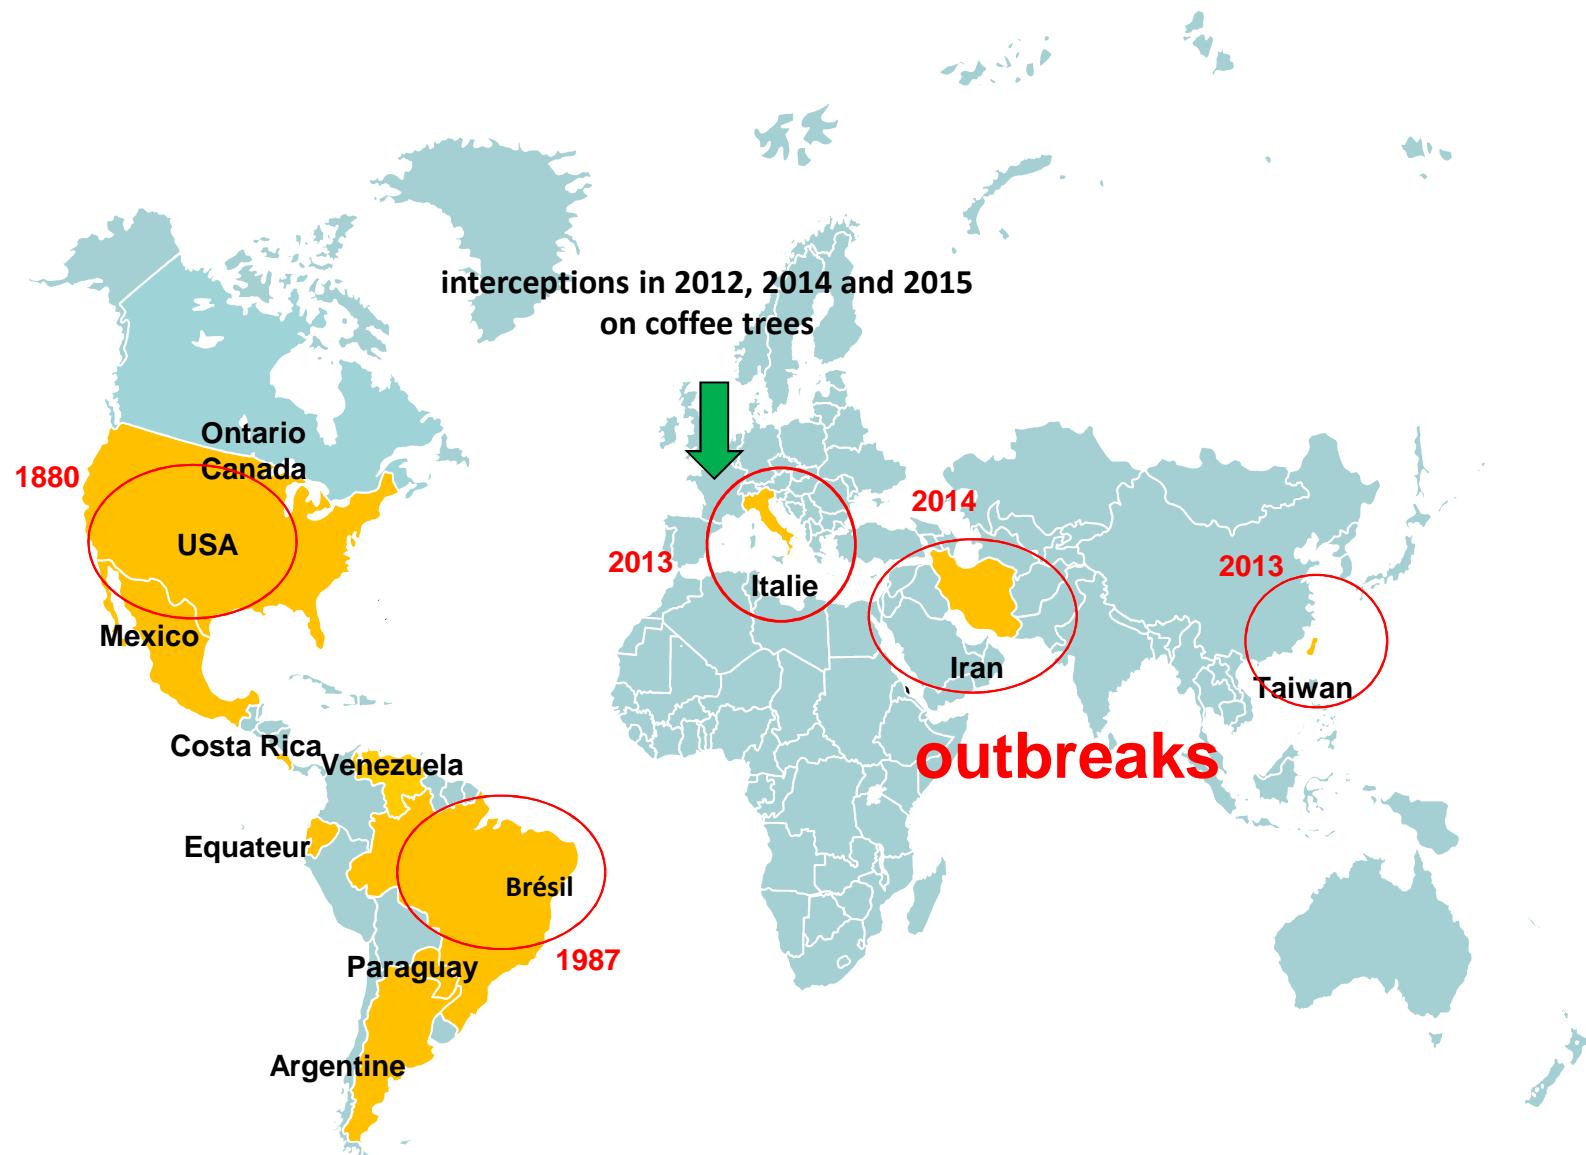

X.f. within a xylem vessel in the leaf of affected Chardonnay grape. (ca. x 4,000). [E. W. Kitajima](#) (ESALQ/USP/Brazil).

- Transmitted by:
 - Insect vectors (*Cicadellidae, Cercopidae, Cicadidae*)
 - Infected plants for planting
- Quarantine disease (2000/29CE)

**XYLELLA FASTIDIOSA IN COFFEA
ARABICA ORNAMENTAL PLANTS
IMPORTED FROM COSTA RICA AND
HONDURAS IN THE NETHERLANDS**

2014: The Netherlands, Italy,
Germany

2015/181 *Xylella fastidiosa* detected in *Coffea* spp. plants in Switzerland

Following the detection of *Xylella fastidiosa* (EPPO A1 List) by the Swiss Federal Institute of Technology (ETH) in Zurich, tracing-forward studies were conducted in Switzerland. In September 2015, the presence of *Xylella fastidiosa* was confirmed in *Coffea* plants imported from Costa Rica and Honduras.

2015:
Switzerland

Isolation of strains from *Coffea*:

- 2012: subsp. *fastidiosa/sandyi* and subsp. *pauca*
(Jacques *et al.*, in revision)
- 2014 ; 2015: subsp. *sandyi*; subsp. *pauca*

Our experience on *Xylella* in France:

- (2000) IF tests for Quarantine on *Vitis*, *Citrus*, *Prunus*
- (2012; 2014; 2015) Import / survey of territory: coffee plants intercepted.
- Improvement of detecting scheme / test perf studies:
 - Intra laboratory study: diagnostic sensitivity, specificity, detection threshold..
 - 2014: Inter-laboratory comparison (6 labs; Italy, The Netherlands, New Zealand, France)
 - 2015: French reference method MA039

Comparison with an alternative extraction method: QuickPick™ SML Plant DNA (Bio-Nobile) vs DNeasy®

Performance criteria (%)	DNeasy® Plant mini kit Qiagen	QuickPick™ + Robot (BioSprint 15 = KingFisher™ mL)	QuickPick™ + magnets (manual protocol)
Diagnostic sensitivity	52,8	80,6	79,2
Diagnostic Specificity	100	100	100
Repeatability	97,8	97,8	96,6
Limit of detection	Orange≈ 10 ² bact./mL Grapevine≈10 ⁶ bact./mL Olive≈10 ⁵ bact./mL	Orange≈ 10 ² bact./mL Grapevine≈10 ³ bact./mL Olive≈10 ⁵ bact./mL	

Improvement of the limit of detection and sensitivity ;
Always some matrices with “inhibitors”

Official French protocol MA 039

1. Preparation of sample :

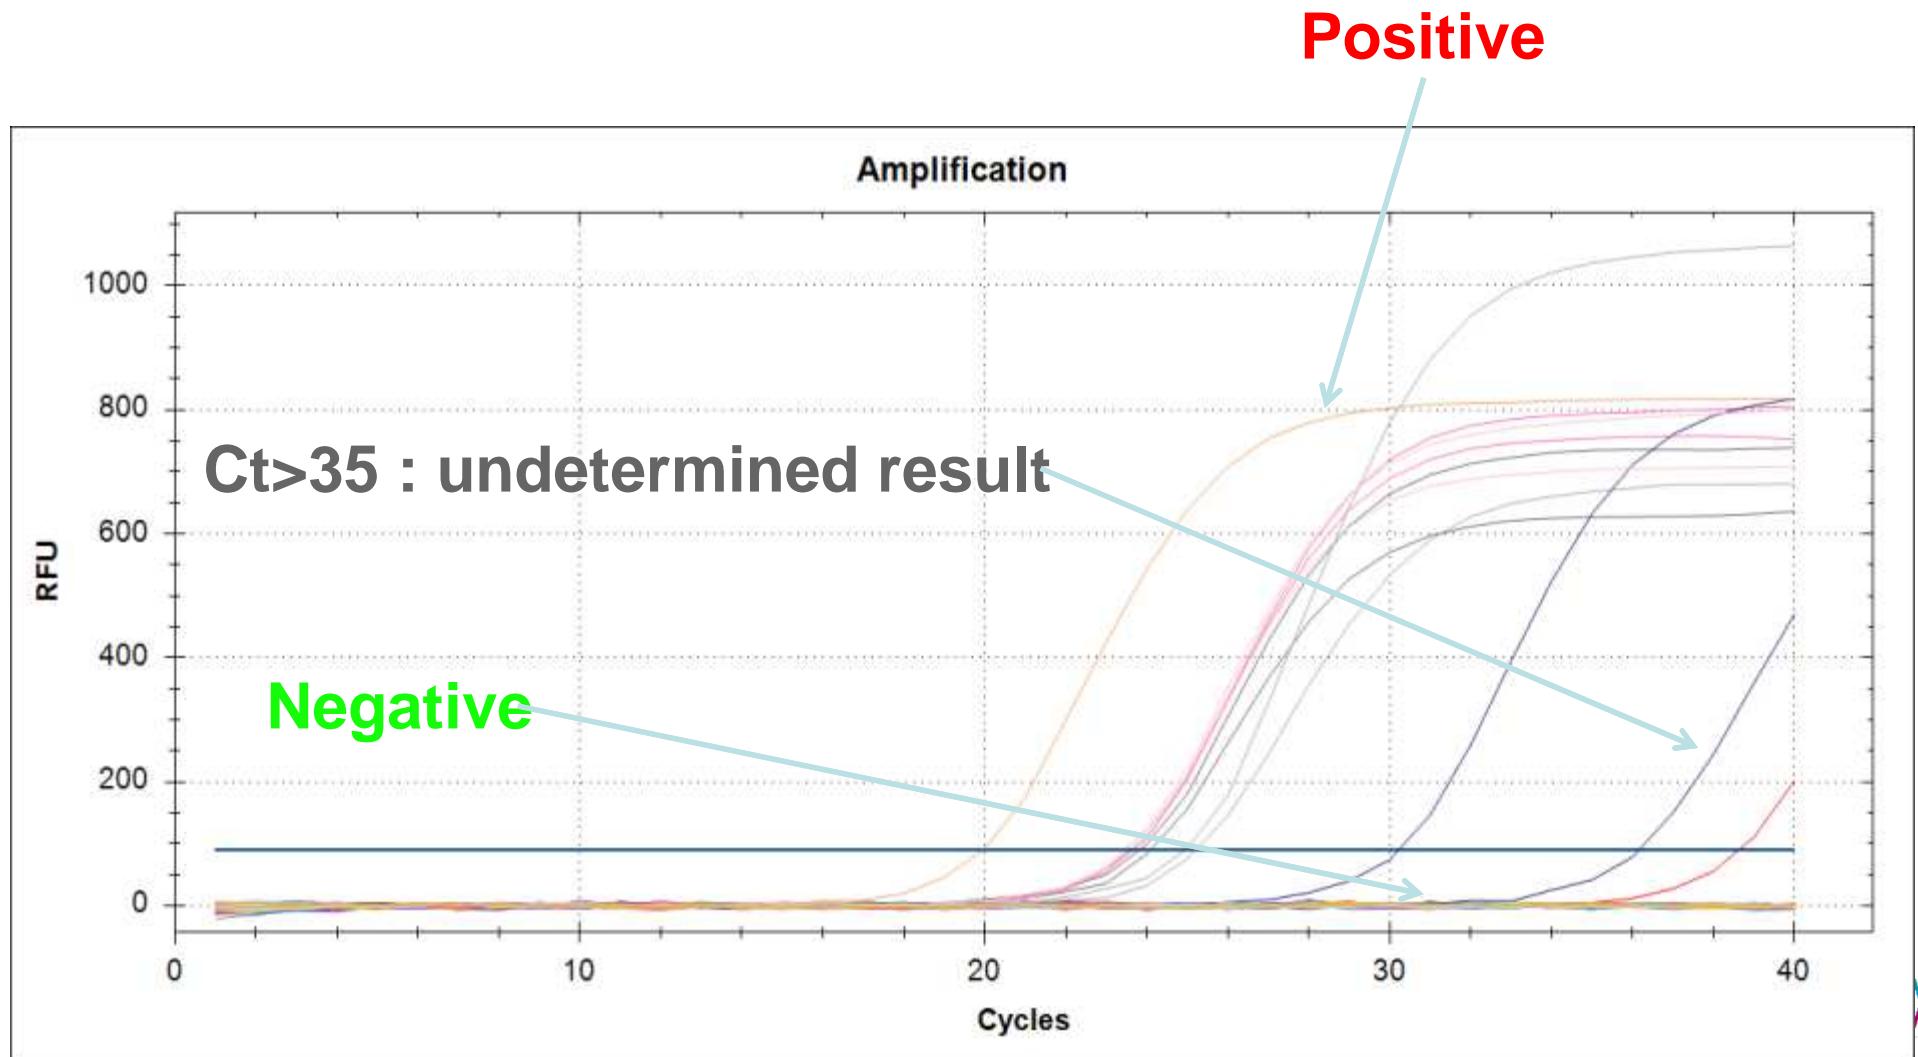

- Cutting and soaking of **0,5 to 1 g of petioles / midribs** in water; grounding (minimum 15 minutes under shaking)
 - Use of **250 µL** of macerate per replicate
 - **asymptomatic / symptomatic : min 2 replicates**
- Centrifugation 20 minutes / 20 000 g → pellet

2. DNA extraction with the QuickPick kit (Bio –Nobile)

3. Real-time PCR Harper *et al.* 2010, 2013 – 2 repeats per replicates

Official French protocol MA 039

Real-time PCR results

Our experience on *Xylella* in France:

- (2000) IF tests for Quarantine on *Vitis*, *Citrus*, *Prunus*
- (2012; 2014; 2015) Import / survey of territory: coffee plants intercepted
- Since 2012: Improvement of detecting scheme
- 2015: French reference method MA039
- **First detection in Corsica in July 2015**

The NPPO of France recently informed the EPPO Secretariat of the first record of *Xylella fastidiosa* (EPPO A1 List) on its territory. During an official visual inspection, carried out in the framework of the surveillance programme against *X. fastidiosa*, a hedge of 31 desiccated plants of *Polygala myrtifolia* was observed on 2015-07-20, on the island of Corsica. This hedge was located along a wall, near a parking lot, in a commercial area of the municipality of Propriano (Corse du Sud department). Samples were collected and tested (real-time PCR, IF) by the ANSES reference laboratory. The identity of the bacterium was confirmed on 2015-07-22 and serological tests revealed a high concentration of the bacterium in tested plant tissues. The isolation of the bacterium on growing medium is under way and results will probably be obtained within 3 to 4 weeks. It is suspected that infected *P. myrtifolia* plants had been imported from another EU member state, but a study is being carried out to confirm this. All infected *P. myrtifolia* plants were destroyed by burning on 2015-07-23.

In accordance with a contingency plan, official phytosanitary measures were immediately taken to eradicate the disease (e.g. insecticide treatments, plant destruction). An infected area with a radius of 100 m around infected plants has been demarcated, as well as a buffer zone with a 10 km radius. Further studies are being made to determine the extent of the infected area. All known host plants of *X. fastidiosa* located in the infected area, as well as any plant showing suspicious symptoms, are being destroyed. In the infected area, the following host plants were present: *Rosmarinus officinalis*, *Westringia*, *Polygala myrtifolia* and *Olea europaea* (as explained above, only *P. myrtifolia* plants were found to be infected). On 2015-07-22, insects were collected by aspiration and specimens are being identified by the entomology laboratory of Anses. Finally, an information campaign has been launched, in particular to warn passengers that they should not bring plants into Corsica.

The pest status of *Xylella fastidiosa* in France is officially declared as:

Corsica: Transient, actionable, under eradication.
Mainland: Absent, intercepted only.

2015/180 *Xylella fastidiosa* detected in Alpes-Maritimes, mainland France

In France, *Xylella fastidiosa* (EPPO A1 List) was first found in July 2015 on the island of Corsica, mainly on *Polygala myrtifolia* (EPPO RS 2015/144 and 2015/161). Since this initial record, new information has been published on the Internet by the official authorities and a map showing infected areas (174 foci as of 2015-10-30, and their buffer zones of 10 km radius) can be viewed on the Internet [[Link](#)].

In October 2015, *X. fastidiosa* was detected for the first time in Alpes-Maritimes department (Southern France). A first case (*X. fastidiosa* subsp. *multiplex*, same

Conclusion

- According to our experience,
 - Outbreaks in France are different of Italian
 - Introduction of plants from infected countries: very big threat for Europe
 - Survey of imported plants and of territory is necessary to prevent and protect agriculture
- Using of sensitive and reliable tools for early detecting : big challenge for EPPO members
- Next step: working on insect detection
