

EU project number 613678

**Strategies to develop effective, innovative and practical approaches to protect
major European fruit crops from pests and pathogens**

**Work package 1. Pathways of introduction of fruit pests and
pathogens**

Deliverable 1.3.

**PART 2 - Analysis of fruit production and imports in the EU to
select species for pathway studies**

Partners involved: EPPO (Grousset F, Petter F, Suffert M) and JKI (Steffen K, Schrader G)

DROPSA is funded by the European Union's Seventh Framework Programme for research, technological development and demonstration (grant agreement no. 613678).

DROPSA – ANALYSIS OF FRUIT PRODUCTION AND IMPORTS IN THE EU TO SELECT SPECIES FOR PATHWAY STUDIES

1. Background

Fruit species have to be selected in order to produce "Alert lists" of pests. The number of fruit species that could be dealt with during the course of this task was not known, as it depended on the time needed to complete each species. Therefore, priorities were defined to be taken in order until the time available had run out. Criteria taken into account to select fruit species were:

- production area in the EU (from statistical data in Eurostat).
- import volumes into the EU and origins, including importance of imports from other continents versus imports from closer countries (EPPO region), consideration of emerging trades (from Eurostat and detailed trade data provided by some EPPO countries).
- prior history of pest introduction as per the list established in the review (Steffen et al. 2015¹ and the associated Excel file Fruit_pest_list_review_final.xls²).

The overall selection aimed at providing:

- a good geographical coverage of fruit production in the EU
- a balance between species regulated for fruit in the EU, and others.
- species in different broad groups (e.g. pome fruit, stone fruit, citrus, small fruits).
- emerging trades, if such could be identified.

It is worth noting that, for all crops retained, there are some exporters in the Northern hemisphere (i.e. where fruits are produced during the EU fruiting season). In addition, all species retained are grown in gardens as well as in commercial production. Consequently, these two elements were not used as a selection factor.

It was discussed whether the pathway study of some fruit species could focus on some origins only. However, the analysis showed that fruits are imported from a large number of countries and the trade is volatile so that import can occur from different countries depending on years. It was finally concluded that each species would be studied from all origins.

The analysis was originally performed for fruits and nuts. Section 2 and 3 provide details on production areas and imports for fruit and nut species. Section 4 analyzes this data. Section 5 reviews the additional trade data provided by some EPPO member countries. Section 6 identifies priority fruit crops, with a rationale.

2. Production area of fruit and nut species in the EU

Data on production areas and increase/decrease over 2002-2012 were used as a parameter of the relative importance of the crop in the EU. A choice was made to focus on the production area, i.e. the plants to be protected from the introduction of pests, rather than on the production volume or value.

Data on production area needs to be interpreted with caution as figures were missing for major producing countries in some years. Corrected total EU areas were calculated, in order to account for missing figures, and avoid wrongly identifying huge decreases of production areas in one year. The resulting figures are approximate, but nevertheless allow identifying substantial increases/decreases at EU level.

Figures 2a and 2b present production areas for fruit and nut species for 2002, 2008 and 2012 (based on corrected data in Annex 1). The increases/decreases of area of production between 2002-2012 and 2008-2012 are presented in Table 2a (in order of importance of the increase/decrease between 2002 and 2012).

Figure 2a. Total area (1000 ha) for fruit crops (with corrected data).

Note the figures for vineyards exceed the axis and are given as numbers (1000 ha)

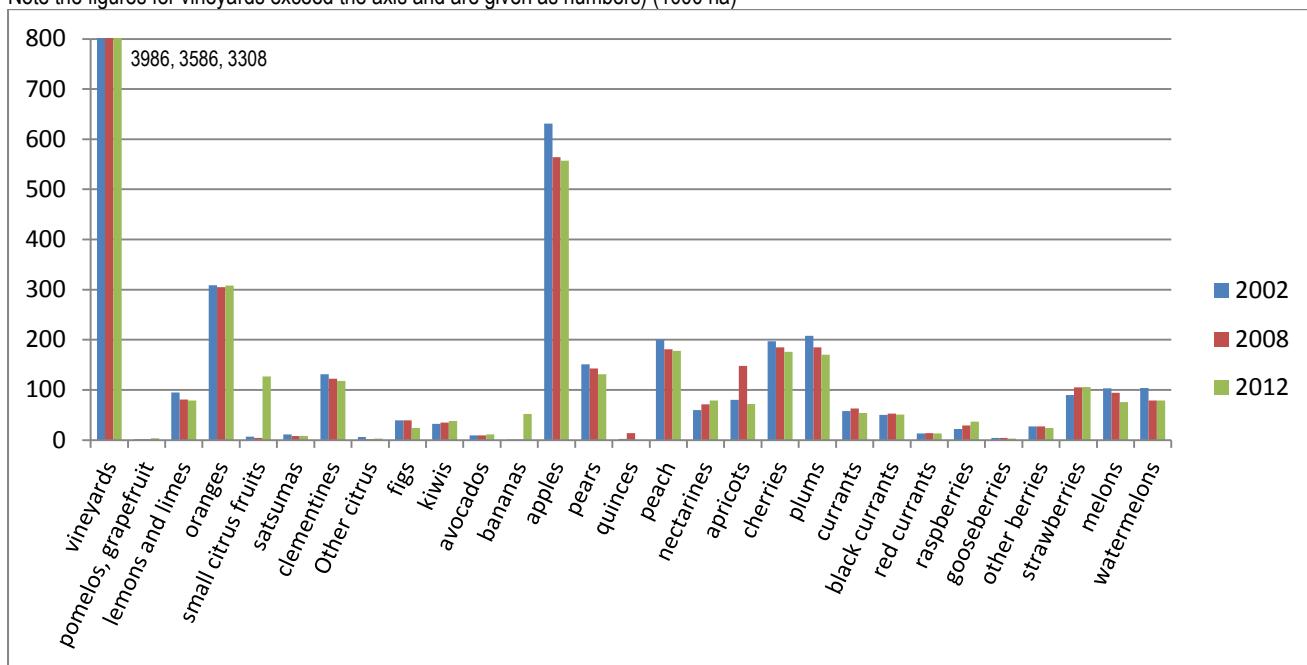

Figure 2b. Total area (1000 ha) for nut crops (with corrected data)

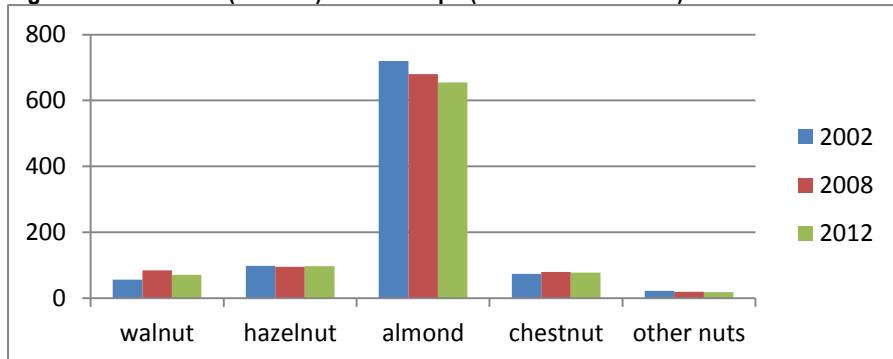

Table 2a. Fruit and nuts: area of production in 2012 and variations in 2002-2012 and 2008-2012

	Area 2012 (1000 ha)	Variation in % 2002-2012	Variation in % 2008-2012
vineyards	3308	-17,0	-7,8
apples	557	-11,7	-1,2
oranges	308	-0,3	1,0
peach	178	-11,0	-1,7
cherries	176	-10,7	-4,9
plums	170	-18,3	-8,1
pears	131	-13,2	-8,4
mandarins	118	-9,9	-3,3
strawberries	106	17,8	1,0
lemons and limes	79	-16,8	-2,5
nectarines	79	31,7	11,3
watermelons	79	-24,0	0,0
melons	76	-26,2	-19,1
apricots	72	-10,0	-51,4
currants	54	-6,9	-14,3

	Area 2012 (1000 ha)	Variation in % 2002-2012	Variation in % 2008-2012
black currants	51	2,0	-3,8
kiwis	38	18,8	8,6
raspberries	37	68,2	27,6
figs	24	-38,5	-38,8
other berries	24	-11,1	-11,1
quinces*	14		
red currants	13	0,0	-7,1
avocados	11	22,2	22,2
satsumas	8	-27,3	0,0
pomegranates, grapefruit	3,4	112,5	78,9
gooseberries	3	-25,0	-25,0
other citrus	2,8	-53,3	47,4
small citrus fruits&	127	1714,3	3075,0
bananas#	52	5100	5100

& the data for "small citrus fruit" could not be used. It is not clear if this was previously recorded in other categories, and which species it might be.

* data for quince in 2012 is not available. The figure is for 2008.

data for bananas seems to be an anomaly

Table 2b. Nuts: area of production in 2012 and variations in 2002-2012 and 2008-2012 (corrected values)

	Area 2012 (1000 ha)	Variation in %	
		2002-2012	2008-2012
almond	655	-9,0	-3,7
hazelnut	97	-1,0	2,1
chestnut	78	5,4	-2,5
walnut	71	24,6	-16,5
other nuts	19	-17,4	-5,0

3. Imports of fruits and nuts to EU countries

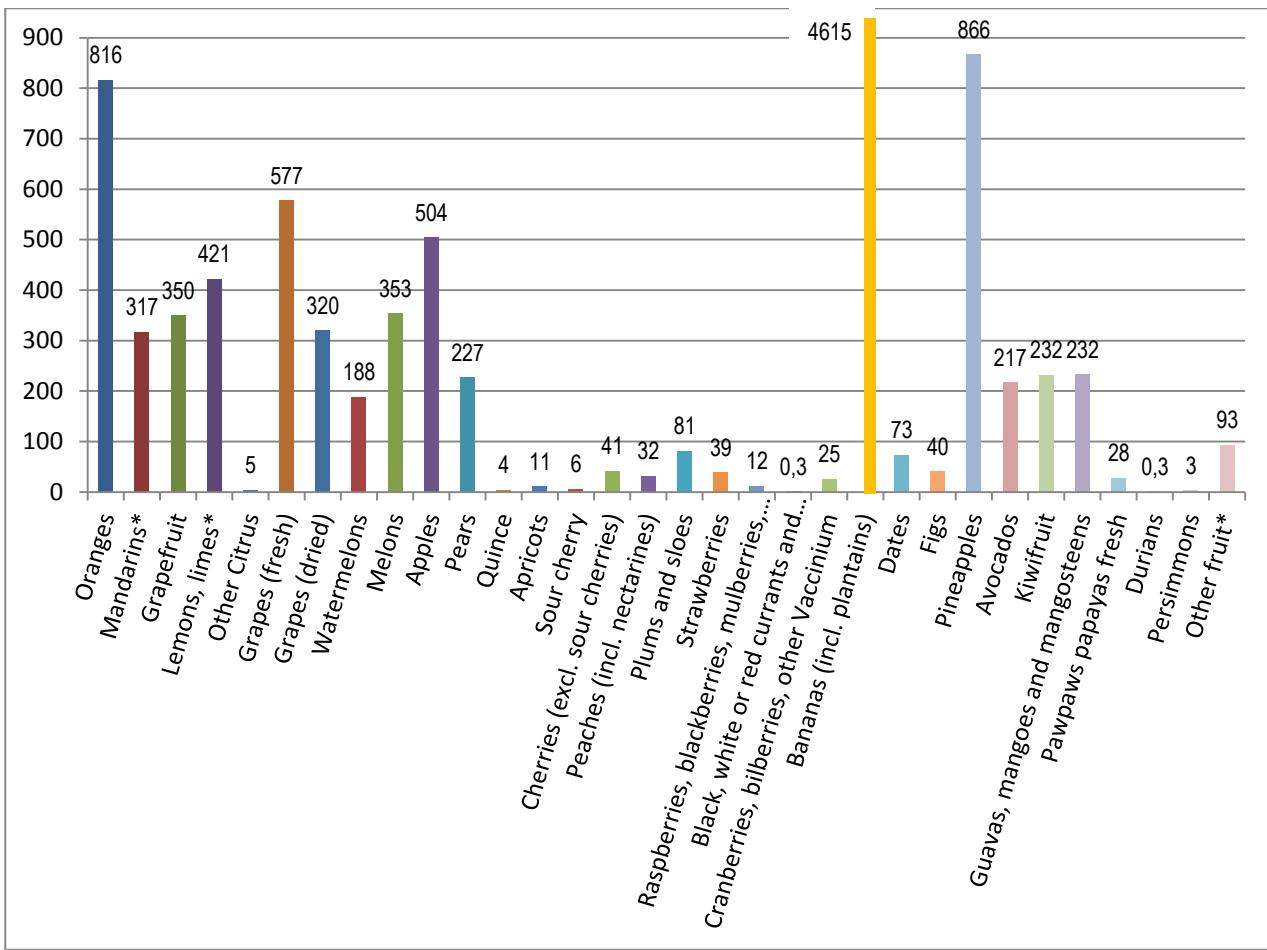

EU countries import a wide variety of fruit and nuts. The fruit categories in Eurostat are shown in Figure 3a. They relate to individual species, e.g. ‘watermelons’, or to small or wider groups of related species, e.g. ‘peaches and nectarines’, ‘cranberries, bilberries, other *Vaccinium*’. The detailed trade data from EPPO countries (section 5) showed that categories that may ‘intuitively’ be understood to cover one species may in fact cover several. All other fruits, not part of other categories, are covered under ‘tamarinds, cashew apples, jackfruit, lychees, sapodillo plums, passion fruit, carambola, pitahaya, other edible fruit (excluding all others listed)’. For some categories, the data separate fresh/dried fruit (e.g. grape, apricots); for others, fresh/dried fruits are combined (e.g. banana, figs, dates). For nuts, data may combine fresh and dried nuts, shelled or not.

Figure 3a presents the volumes of imports into the EU from non-EU countries in 2012 for the fruit categories in Eurostat (in 1000 t), and Figure 3b the internal EU trade of the same fruit categories. Figure 3c (based on data from FAOStat) presents import values. The fruit categories in decreasing order of import volumes from non-EU countries are given in Table 3a. Corresponding data is given for nuts in Figures 3d-e and Table 3b. Detailed data underlying Figures 3 and Tables 3 can be found in Annex 2.

Import volumes from non-EU countries³ for some fruit categories in 2002-2012 are illustrated in Figure 3f, separating EPPO countries and other origins. This was considered relevant as pest risks may differ: the pest spectrum between EU countries and EPPO non-EU countries for given crops is more likely to be similar than from other origins, and the trade to have been in place for a longer period (i.e. having provided opportunities for pest introduction). Increases/decreases of trade from non-EPPO countries may not necessarily represent a long-lasting trend. For example, a bad production year in the Mediterranean Basin may lead to a decrease of production in both EU and EPPO non-EU countries, with corresponding increased imports from other parts of the world; however this may be limited to that year. However, the data seems nevertheless to illustrate some general trends. Note: For each species selected for further study, origins are analyzed in the specific report on that fruit.

Figure 3a. Imports of fruits (volume, in 1000 t) from non-EU countries into the EU (28) in 2012. Note: the value for banana exceeds the axis

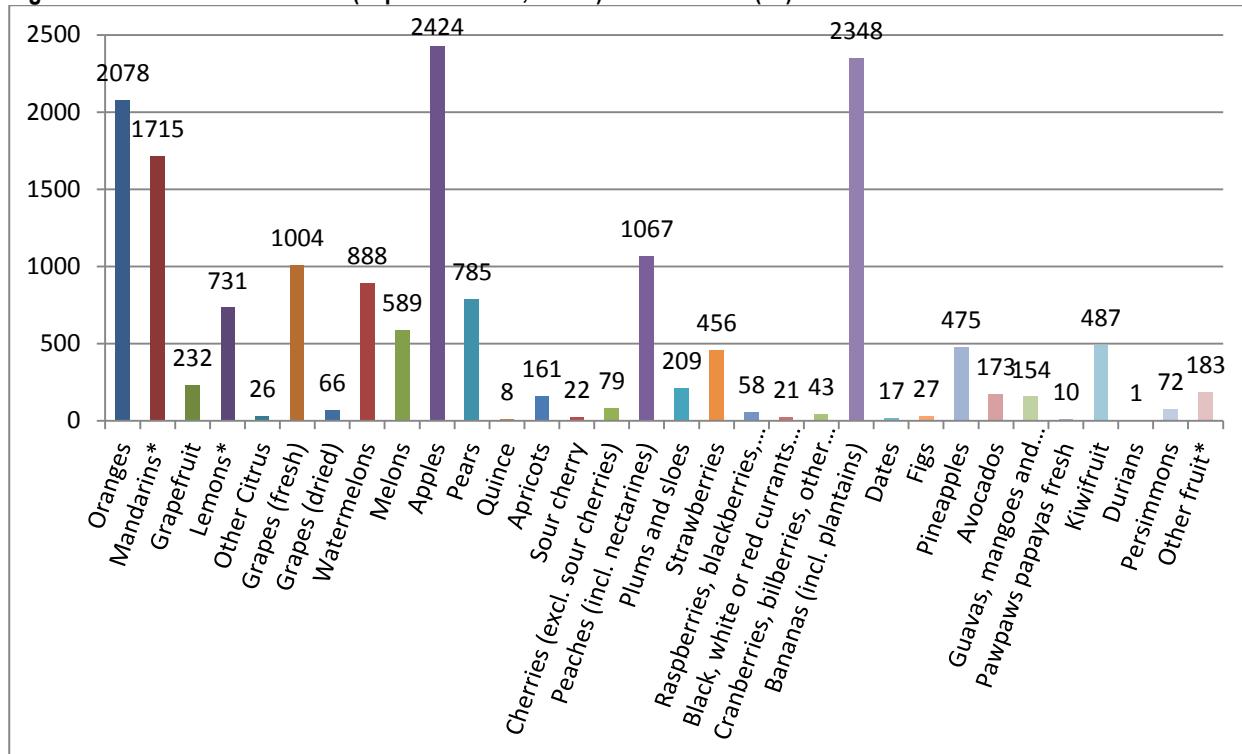

³ As Membership of EU (and EPPO) as evolved over the years, a country is considered as ‘EU’ or ’EPPO’ according to its status in 2015 (e.g. data for Hungary is considered as data for an EU country, even before it joins in 2004)

* Short names were used for some categories in Eurostat and some names are shortened with ... above, as follows:

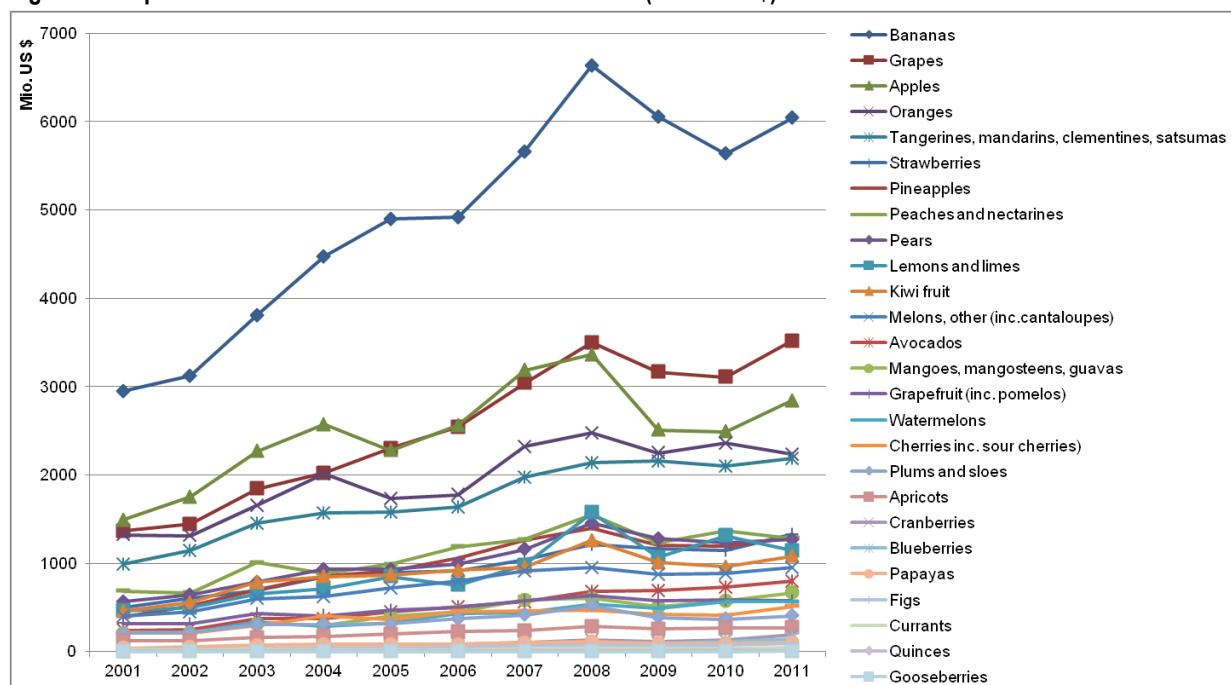

"**Mandarins**": including tangerines, satsumas, clementines, wilkins and similar *Citrus* hybrids; "**Lemons, limesCitrus limon, *Citrus limonum*) and limes (*Citrus aurantifolia*, *Citrus latifolia*); "**other Citrusblack-, white- or redcurrants and**" gooseberries; "**raspberries, blackberries, mulberries**" and loganberries; "**Other fruit****

4. Analysis of the data on production area and import volumes

Vineyards represent by far the largest fruit crop in the EU, with over 3.3 million hectares in 2012 (mostly for wine production). Citrus (collectively) and apple each occupy over 550 000 hectares in the EU. These fruits are also amongst the most imported into the EU with over 1.9 million tonnes for Citrus (collectively) and over 500 000 tonnes for fresh grapes and apples. The production areas for apples and grapes have decreased between 2002 to 2008 and to 2012, but remain major. Imports of fresh grapes from non-EU countries have substantially increased in 2002-2012 (by 200 000 t). Imports of apple seem to have decreased but are still substantial. Finally, regarding internal trade within the EU, Citrus (collectively), apples and bananas are the most traded fruits, amounting to 4.8 million t, 2.4 million t and 2.3 million t. As these volumes take account of fruit produced within the EU and re-exported fruit, it only indicates that internal trade is high.

From non-EU origins, bananas are by far the most imported fruit (with over 4.6 million t in 2012), while the volume of all Citrus species together reached over 1.9 million t, and pineapples 0.8 million t. In value, also bananas are most important, followed by grapes, apples and oranges (Figure 3c, from another dataset).

In 2002-2012, only a few species present substantial increases of production areas. These are (in order of variation): pomelos and grapefruit, "raspberry, blackberries, mulberries and longanberries", nectarines, avocados, kiwis and strawberries (see Table 2a)⁴. Among these, only grapefruit imports from non-EU countries have decreased in 2002-2012, especially from non-EPPO countries. Imports of some others show notable increases between 2002 and 2012 ("raspberry, blackberries, mulberries and longanberries", avocados) For avocado, Spain is the only producer with more than 1000 ha (and minor areas reported in France, Greece and Cyprus).

Many categories present a decrease of production area from 2002 to 2008 and to 2012, such as: figs, satsumas, gooseberries, melons, watermelons, plums, lemons and limes, other berries, peach, pears, mandarins, lemons and limes. Of these, watermelon, melon and cherries show an increase of imports from outside the EPPO region since 2002, and figs a quite stable import. Others ("lemons and limes", plums, "pears and quince") present a decrease of imports between 2008-2012 (after an increase in 2002-2012).

Finally both imports and production area of 'black, white, red current and gooseberries' have substantially decreased since 2002. Imports of durian have also decreased, and a small production area is recorded in the EU (300 ha).

The contribution of EPPO non-EU countries to EU imports depends on fruit groups. Over 2002-2012, it remained at a low level for most tropical fruits and has increased for most others. In 2008-2012, import volumes were notably higher only for other *Citrus* fruits (other than individual categories) and for cherries. Most other fruit categories showed an increase in import volumes from non-EPPO countries. For some, the increase was slight (e.g. bananas, papayas, citrus (except lemons and miscellaneous citrus), dates and figs). For others, it was a considerable increase (e.g. pineapples, 'guavas, mangoes and mangosteens', avocados, kiwifruit, lemons and limes' (fresh or dried), miscellaneous citrus fruit, fresh grapes, watermelons and melons, strawberries, 'raspberries, blackberries, mulberries, longanberries', *Vaccinium*).

In 2008-2012, the only continuous increases in volumes of imports (EPPO or non-EPPO countries) are for *Vaccinium*, avocados and other Citrus (see footnote), cherries, as well as a slight increase of 'raspberries, blackberries, mulberries, longanberries', dates and figs. Imports of papayas in 2008-2012 decreased considerably, while 'guavas, mangoes and mangosteens' were stable. CBI (2013a) note that imports of lime increased by 35 % in 2008-2012, which is not reflected in the import data for the group "lemon and lime".

Vaccinium was analyzed separately as Eurostat does not give data on production areas. CBI (2013b) note that the production of France, The Netherlands, Poland and Germany amounted to 30 000 t in 2011 (while imports from non-EU countries reach 25 000 t). Import data in Eurostat show a continuous increase and doubling of imports from outside the EU between 2002 and 2012, with non-EPPO origins accounting for 80% of imports.

⁴ The category "small citrus fruit" or "other Citrus" also present substantial increases, but it is not clear if these categories have been recorded differently in previous years, nor what they cover exactly. The data for banana seems to present anomalies.

Bananas and pineapples are the most imported fruits (in volume), with respectively over 4.6 and 0.8 million t. CBI (2013c) indicates for pineapple that Portugal is the only EU producing country (small volume – 3000 t in 2011). Although Eurostat shows substantial production areas for banana, these data may reflect anomalies or changes in the recording of production (31 000, 10 000 and 9 000 ha reported in Bulgaria, France and Spain in 2012; no data for 2002 and 2008). A few other fruits imported in quantities over 10 000 t are not cultivated, or not important enough to be recorded separately in Eurostat, such as ‘guavas, mangoes and mangosteens’, as well as papayas. Papaya imports decreased considerably in 2008–2012, while ‘guavas, mangoes and mangosteens’ were stable with a larger proportion imported from EPPO non-EU countries, which may indicate a more general increase of production in Mediterranean countries. However, there was no data for production area in the EU, and these fruits are probably marginal at the scale of the EU. Other fruits not specifically studied here may be in the same situation, such as pomegranate. Not surprisingly, “tropical” fruits are mostly imported from outside the EPPO region. This is also the case of kiwifruit, which in the EU is cultivated mostly in Italy, and to a lesser extent in Greece, France, Portugal and Spain.

It should be noted that some figures may result from anomalies in the data rather than from actual increases/decreases of production areas. For example, the decrease of apricot production between 2008 and 2012 is due to a much larger area in Spain in 2008 compared to 2002 and 2012 (not logical for a tree crop); the increase of banana in 2008–2012 is detailed above; and “sour cherry” seems to appear in 2012, but was probably not recorded separately prior to this date (and is not included as a separate category in Figure 2a).

For nuts, production areas in the EU were relatively stable. Almond is the most widely-grown nut crop in the EU, with over 655 000 ha. For walnut, the overall area was stable, but there were important variations by country between 2002–2012, with substantial increase in Poland and Greece, and decrease in Bulgaria. Almond is also the most imported nut (over 210 000 t in 2012), followed by coconut (in all forms) and hazelnut.

5. Additional data on fruit trade to identify emerging trades

The EPPO Panel on Phytosanitary Measures was consulted on a preliminary selection of fruit, which was based on the above. It commented that the proposed selection did not take account of emerging risks due to lack of data. This is because Eurostat data is given at the species/genus only for ‘established’ trades (see section 3, bananas, apples); where wide categories are used, any increase in trade cannot be attributed to individual species/genera, and emerging trades cannot be identified. One major concern was that emerging trade of fruit may serve as a pathway for polyphagous pests, which may then transfer to widely cultivated species. The Panel noted that a detailed import database would be needed to allow identification of unknown emerging risks. However, such a database does not exist yet. It was decided that NPPOs of EPPO countries would be contacted to obtain additional data on imports of fruit (especially fruit not regulated in the EU, and for which specific data is missing). A request was sent for detailed data per genus and if possible per species, for fruit imports other than fruit species already recorded individually in custom databases, for 2013 and 2014.

Data was received from Austria, Cyprus, Czech Republic, Denmark, France, Germany, Israel, Lithuania, Malta, Poland, Romania, Slovenia, UK. Several other countries answered that they did not have data at a more detailed level than Eurostat (Belgium, Finland, Guernsey). The data varied in content and coverage, some countries providing selected data for non-regulated fruit, others data for a wide variety of commodities. Data came from a limited number of EPPO countries, most minor fruit importers (in volumes) of a limited number of species/genera of interest (i.e. not those already known as major trades). The origins were not always indicated (i.e. also covering fruit traded within the EU), including for some major fruit importers. Where they were indicated, many fruits imported by minor importers came from EPPO countries (e.g. Israel, Morocco, Tunisia, Balkans). Some data was provided at the level of fruit species/genera, and some to the same level as available in Eurostat (or slightly smaller groups). Only France and a few minor importing countries (in fruit volume) provided data both at the species/genus level and details on origins. Consequently due to the little number of answers giving data on origins for fruits potentially of interest (i.e. not already detailed in Eurostat), the data could not be used to identify emerging trades from non-EU origins, nor to draw an overall picture of origins from non-EU countries. Consequently, it was suggested that the priority list be retained as it was.

However, the data gave interesting information when at the level of fruit species/genus:

- Eurostat categories may be broader than intuitively understood (e.g. ‘apricot’, in addition to *P. armeniaca*, may contain *Prunus mume*, Japanese apricot; plum, in addition to *P. domestica*, may contain *P. americana* and *P. salicina*, American and Chinese/Japanese plums). These fruit may differ in their intended use and possibly also in the state in which they are imported.
- The large diversity of species in some categories, for example species and hybrids of *Citrus*, *Passiflora* species, *Annona* species.
- The large diversity of species/genera of other fruits; there are probably only a few species in “other nuts” because many nuts are individual categories in Eurostat.
- The difficulties of names in such data. For example, *Pyrus domestica* shows in the data, which in terms of scientific names is a synonym of *Sorbus domestica*. Data often records synonyms, which complicates data analysis (and, as for citrus, there may be several understandings of how the species are synonymized and classified).

The list below is partial because only few countries provided data at species level, and the list of traded species is presumably longer (e.g. *Garcinia mangostana*, mangosteens, in the category ‘guavas, mangoes and mangosteens’; blackberries, mulberries and longanberries in the category that includes raspberry). For most species below, the corresponding genera also appear in data without details of species.

Table 5. Fruit indicated as species level in trade data

Species were grouped below within the Eurostat categories. This was based on their common or Latin names, and may not correspond to the category/Customs code under which they were recorded. In some cases, it is not clear under which category/customs code they would fall in trade data (e.g. *Pyrus malus* is a synonym of *Malus sylvestris*; apples or pears?, *Citrus japonica* is a synonym of *Fortunella japonica*, other citrus or other fruit? Especially categories of citrus seem unclear).

Eurostat categories	Species mentioned in detailed trade data (with names as in EPPO Global database)
Individual categories of Citrus: oranges, mandarins, grapefruit, lemons and limes, others	Oranges : <i>C. aurantium</i> , <i>C. sinensis</i> Mandarins : <i>Citrus clementina</i> , <i>Citrus reticulata</i> (<i>C. nobilis</i>), <i>C. unshui</i> (<i>C. reticulata</i> var. <i>unshiu</i>), <i>C. reticulata</i> x <i>C. paradisi</i> , <i>C. tangerina</i> , <i>C. × tangelo</i> , Grapefruit : <i>C. maxima</i> (<i>C. grandis</i>), <i>C. paradisi</i> Lemons : <i>C. limon</i> (<i>C. limonum</i>) Limes : <i>C. aurantifolia</i> (<i>C. limonellus</i>), <i>C. latifolia</i> , Others : <i>C. hystrix</i> , ‘ <i>C. japonica</i> ’ (= <i>Fortunella japonica</i>), <i>C. junos</i> , <i>C. limetta</i> , <i>C. × limonia</i> , <i>C. medica</i> . (note. Some of these may be types of limes or lemons, but the Customs codes names limit these categories to the species above.)
Apples	<i>Malus domestica</i> , <i>M. pumila</i> (<i>M. communis</i>), <i>M. sylvestris</i> (<i>Pyrus malus</i>)
Pears	<i>Pyrus communis</i> , <i>P. domestica</i> (<i>Sorbus domestica</i> ?), <i>P. pyrifolia</i>
Quinces	<i>Cydonia oblonga</i> (<i>C. vulgaris</i>), <i>C. sinensis</i> (= <i>Chaenomeles sinensis</i>)
Cherries	<i>Prunus avium</i> , <i>P. cerasus</i> (<i>P. vulgaris</i>)
Peaches (incl. nectarines)	Peaches : <i>Prunus persica</i> Nectarines : <i>P. persica</i> var. <i>nucipersica</i>
Apricots	<i>P. armeniaca</i> , <i>P. mume</i>
Plums and sloes	Plums : <i>Prunus domestica</i> (<i>P. sativa</i>), <i>P. americana</i> , <i>P. salicina</i> Sloes : <i>P. spinosa</i>
Black, white or redcurrants and gooseberries	black currant : <i>Ribes nigrum</i> red currant : <i>R. rubrum</i> (<i>R. sativum</i>) gooseberry : <i>R. uva-crispa</i>
raspberries, blackberries, mulberries and loganberries	Raspberry : <i>Rubus idaeus</i>
Cranberries, bilberries, other vaccinium	Cranberries : <i>V. macrocarpon</i> Bilberries/blueberries : <i>Vaccinium corymbosum</i> , <i>V. myrtillus</i> Lingonberry : <i>V. vitis-idaea</i>
Guavas, mangoes and mangosteens	Guavas : <i>Psidium cattleianum</i> , <i>P. guajava</i> Mangoes : <i>Mangifera indica</i> , <i>M. odorata</i>
bananas	<i>Musa acuminata</i> , <i>M. paradisiaca</i> (<i>M. sapientum</i>)
Other fruit: tamarinds, cashew apples, jackfruit,	Litchis: <i>Litchi chinensis</i> , <i>Nephelium lappaceum</i> (rambutan) Passionfruits: <i>Passiflora edulis</i> , <i>Passiflora edulis</i> f. <i>flavicarpa</i> , <i>Passiflora laurifolia</i> , <i>Passiflora</i>

lychees, sapodillo plums, passion fruit, carambola, pitahaya, other edible fruit (excl. others listed)	<i>ligularis</i> , <i>Passiflora mollissima</i> Carambola : <i>Averrhoa carambola</i> Pitahaya : <i>Hylocereus undatus</i> Custard apples : <i>Annona cherimola</i> , <i>A. muricata</i> , <i>A. reticulata</i> , <i>A. squamosa</i> Jujubes : <i>Ziziphus jujuba</i> , <i>Z. mauritiana</i> Pomegranate : <i>Punica granatum</i> Others: <i>Murraya koenigii</i> , <i>Fortunella margarita</i> , <i>Amelanchier</i> , <i>Syzygium samarangense</i>
Other nuts	<i>Carya illinoiensis</i> (pecan), <i>Pinus pinea</i> (pine nuts), <i>Myristica fragrans</i> (nutmeg)

6. Priorities for further study

The main factors leading to the establishment of priorities are summarized in the table. Imports refer to imports from outside the EU.

1. Apple	2 nd largest production area for fruit, throughout the EU (over 550 000 ha) Large imports (over 500 000 t, rank 5 of all fruits), despite decrease Perennial crop Important crop for EU countries History of interceptions of pests on fruit (Note: fruit regulated for some pests, e.g. <i>Carposina nipponensis</i> , <i>Cydia</i> spp.)
2. Vaccinium	Continuous increase of imports from outside the EU in 2002-2012 (reaching 25 000 t) 30 000 t produced, commercial production extending to the North of the EU. Wild indigenous species also important for fruit picking and ecosystems in the EU Perennial crop Note: fruit not regulated
3. Grapes	1 st production area, throughout the EU (3.3 million ha) Large imports (577 000 t) High value crop, especially for wine production Perennial crop A few pests intercepted on fruit (Note : fruit not regulated)
4. Orange and mandarins	Large production areas (>420 000 ha together) The largest imports among Citrus; 3 rd and 10 th fruits imports, with large volumes (over 816 000 t and 317 000 t) Widely grown in Mediterranean countries Large number of interceptions on fruit (Notes: Fruit regulated for some pests) Due to the importance of most <i>Citrus</i> in the EU, the study focuses on these species, but pests of other <i>Citrus</i> species will also be recorded, although in a less systematic way. The listed in section 5 will be kept in mind.
5. Raspberries*	Increasing production area (over 37 000 ha, with 68% increase since 2002) Continuous increase of imports ("raspberries, blackberries, longanberries") from non-EPPO origins in 2002-2012. Within this category, raspberries are known to be imported (see section 5.) Note: fruit not regulated
6. Cherries*	Major production, although slightly decreasing (over 176 000 ha, with 10.7% decrease in 2002-2012) Substantial imports (over 47 000 t), nearly doubled since 2002 and increasing from non-EPPO countries (although most cherries are imported from EPPO countries) Note: fruit of <i>Prunus</i> regulated
7. Nectarines and peaches	Major increase of production area of nectarine (reaching 79 000 ha with 31% increase since 2002) Major production area for peach (over 178 000 ha) Substantial imports (32 000 t for nectarines and peach) In the EU, mostly grown commercially in Mediterranean and Eastern countries Note : fruit of <i>Prunus</i> regulated
8. Kiwis	Increasing production area (38 000 ha, +18% from 2002) Large imports from non-EU countries, increasing (over 232 000t) However, few producers in the EU, in the Mediterranean area Note: fruit not regulated
9. Strawberries	Large production area, increasing (106 000 ha, +17% from 2002) Moderate imports (39 000 t) and mostly from within EPPO Dropsa focuses on <i>Drosophila suzukii</i> , and fruit of strawberry is one of the pathways considered. Note: fruit not regulated

* In discussions with the EPPO Panel on Phytosanitary Measures, it was suggested that the priority order of raspberry and cherry be reconsidered at a later date if appropriate.

The following species were not retained in the priority list.

10.	Avocados	Small but increasing production (11 000 ha) and large imports (271 000 t) Only major producer in the EU is Spain (over 10 000 ha) Note: not considered a fruit by all Note: fruit not regulated
11.	Pomelos and grapefruit	Small but increasing production (3400 ha, +112% from 2002) and large imports (8 t fruit imports, 350 000 t) Will be covered to a certain extend by "orange and mandarins"
12.	Lemons and limes	3 rd Citrus production area (>79 000 ha) and large imports (6th fruit imports, 420 000 t) Will be covered to a certain extend by "orange and mandarins"
13.	Other citrus	Small production with a large increase (2800 ha +47% from 2008) and small imports (5000 t) Major uncertainty on the species concerned and whether the increase is real or due to different way of registering data for <i>Citrus</i> species over the years. Some of the species traded are listed in section 5. Will be covered to a certain extend by "orange and mandarins"
14.	Guavas, mangoes and mangosteens	Many interceptions in trade, but limited production in the EU
15.	Pomegranates	Possibly increasing production, but still small and concerning a few countries
16.	Pears, quinces	For pome fruit, considered less important than apple, already selected
17.	Apricots	For <i>Prunus</i> , considered less important than peach, nectarine and cherry, already selected
18.	Other berries: blackberries, mulberries, loganberries, currants, gooseberries etc.	Raspberry considered more important in terms of area among <i>Rubus</i> ; <i>Vaccinium</i> and strawberries assessed to be more important than other berries
19.	Melon and watermelon	Grown mostly in Mediterranean countries. Some interceptions, and large production area, but mostly imported from close areas (Mediterranean Basin)
20.	Almond	Large production area (over 575 000 ha). However, introduction with soft fruit considered more likely than with fruits with shell, which may also be imported dry. Other <i>Prunus</i> selected (peach, nectarine, cherries)
21.	All other nuts	Minor compared to fruit. May be imported dry, i.e. less likely to introduce pests.

ANNEX 1. Areas of production of fruit and nuts in the EU 28 countries (based on Eurostat)

Some categories are totals of others (e.g. vineyards (all)).

When sums were missing for one country, they were added. Major missing figures (over 1000 ha) are highlighted in green, and a corrected total for the EU is provided (with missing figure added for that country, based on mean of 2002-2012 (if 2008 missing) or based on previous/following year (for 2002 and 2012). The aim is not to obtain a precise figure, but to cancel seemingly huge variations in total EU due to missing data.

[Totals and corrected totals sometimes at the end of the table, sometimes at the top.]
